- 4Fluid Imaging Technologies, Inc., Yarmouth, ME

Environmental Measurement Symposium 2012 Washington, DC

Overview

- Technology need
- Introduction the Submersible FlowCAM® (an *in situ* particle/plankton sensor)
- Overcoming biofouling for long term deployments
- Testing and Deployments
- 45 day time series, Ponce Inlet, FL
- Conclusions

Why a submersible particle imaging tool?

- Harmful Algal Bloom (HAB) monitoring (e.g., red tides)
- Noxious algal monitoring in drinking water reservoirs
- Health and safety of aquaculture operations
- Sewage effluent discharge monitoring
- Carbon Cycling in the coastal and deep ocean
- Ocean Observing System (IOOS) moorings

Traditional measurement tools

- Collect discrete sample (frequency and depth)
- Field Preserve / Concentrate in laboratory settling
- Taxonomist manually counts species and abundance
- Limits timeliness of data and spatial/temporal understanding/response

Bench /portable particle imaging instruments

 Gaining ground in environmental studies, including oil particle characterization (e.g., FlowCAM[®])

September 2010

Underwater Instrumentation Challenges

- Reliable operation in a wet, high pressure, corrosive environments.
- Biofouling management and control during long-term deployments.
- Our solution
 - Engineer a commercial instrument (a portable FlowCAM[®]) for underwater operations.

5

FlowCAM[®] – Features

- Based on flow cytometry concepts
- Captures images of all particles in field of view
 - Grayscale or color
- Particle size range (3µm 3mm)
- Multiple Image Acquisition Methods
 - Two Channel Fluorescence detection
 - Auto (fixed frame rate of 1-22 frames/sec)
 - Forward scatter
- VisualSpreadsheet[©]
 - Measures and records 30 parameters per particle imaged
 - Image Recognition with Automated
 Identification, Classification & Enumeration

Submersible FlowCAM® Development

- Battelle and Fluid Imaging Technologies (FIT) teamed to develop a submersible FlowCAM[®] (SFC)
 - Enables real time, in situ particle imaging
- Features
 - 200 meter depth rating
 - 1X, 4X, or 10X magnification
 - Autonomous operation
 - Programmable on/off cycles
 - Configurable triggering (auto, scatter, fluorescence)
 - Flexible deployment
 - Buoy, Pier, ROV, AUV, Shipboard or Fixed-Platform Profiling, Bench
 - Remote configuration, system checking, and control

Battelle Business of Innovation

SFC System Overview

System Layout

- Three joined housings
 - Air filled: electronics & optics (1 atm)
 - Water compensated: sampling chamber
 - Oil filled: contains fluid delivery pump

Fluid Flow Path

- Entirely pressure compensated
- Peristaltic pump
- 1/16" ID Tubing (low cost, removable)
- Glass capillary flow cell

Optical Path

- Imaging done across pressure boundary
- Unique mirrored prism ensures optical path is clean (patent pending)

Biofouling Control Goals & Approach

Plankton or macro fouling -Bacteria or algae Organic layer Substrate

<u>Challenge</u>

- Ensure flow through the flow cytometry cell and system
- Maintain clean optical surfaces to facilitate high quality imaging

Approach

- Two independent systems
 - Copper: Included in initial design
 - UV: Evaluated in parallel to system development

Battelle The Business of Innovation

<u>Biofouling Control</u> Method

Copper

- (A) Cu dissolves and damage cell membrane
- (B) Cell membrane ruptures
- (C) Cu ions cause oxidative reactions within the cell
- (D) Genomic and plasmid DNA degrades

• UV

- Impedes adsorption of organic molecules on glass surface
- Breaks molecular bonds in organic molecules like DNA
- Either inhibits reproduction or kills cells

Image: Applied Environmental Microbiology

Image: NASA

Biofouling Control System Implementation

Copper

- Use copper mesh at inlet/outlet
 - Inhibits growth
 - Prevents ingestion of large particles that may cause mechanical fouling
- Use copper tubing in flow path
 - 12" section before and after pump

UV LEDs illuminate flow cell

Inhibit growth on glass

50 days under water

The Business of Innovation

Testing Overview

- Initial Sea Trial Profiling (Cu only)
 - System test Duxbury, MA (Feb 2010)
- Biofouling Control Concept Tests
 - Lab test Ponce Inlet, FL (Jan Feb 2010)
- UV Exposure Testing
 - Lab Test Ponce Inlet, FL (Aug Sep 2010)
- Lab Endurance Test (copper only)
 - System test Duxbury, MA (Sep 2010)
- Field Endurance Test (Copper + UV)
 - System test Ponce Inlet, FL (Jan Mar 2012)

Test Results Summary Initial Sea Trial (Feb 2010)

Approach

- Lowered system over side from R/V in Plymouth Bay, MA
- Collected data at multiple depths during descent/ascent
- Water temp, air temp approx $0 C^{\circ}$

Downcast

Chaetoceros

The Business of Innovation

Test Results Summary Biofouling Control Tests (Jan – Feb 2010)

Approach

- Tested 3 samples of each method (Cu, UV, UV+Cu) for down-select
- Up to 63 day exposure of two flow cells with constant flow of filtered seawater
- Samples analyzed at Battelle and FIT

Results

- **No Treatment (Control):** Heavy fouling, no flow within 48 days
- Cu: Biofouling and flow reduction after 48 days
- UV: Biofouling and small flow reduction after 48 days
- UV+Cu: No flow reduction; minor biofouling after 63 days

<u>Test Results Summary</u> UV Exposure Testing (Aug – Sep 2010

Approach

- Tested three cytometry tubes at three UV doses (33%, 66%, 100%) on Cu
- 36 day exposure of flow cells with constant flow of filtered seawater
- Confocal microscope and staining used to image fouling in flow cells

Results

- Biofilm accumulation on Cu-only samples similar to previous result
- Effectiveness of Cu+UV treatment similar to previous test results
- Results similar for all UV dosage
 Sept 20 levels (33%, 66%, 100%)

Field Endurance Test (Jan – Mar 2012)

- Assess biofouling and corrosion during 30+ day deployment
 - Fully automated; remotely operated
 - Data acquisition for fifteen (15)
 minutes of every three (3) hours
 - UV always on
 - Depth: 3 to 7.5 ft; Temp: 15 to 22°C
 - Triggering: Chlorophyll & scatter
 - Size threshold: 20 µm to 3000 µm
 - Background calibration at start of each run

The Business o

SFC Setup

Date/Time:

Start: 2012-02-02 11:08:19 End: 2012-02-02 11:23:10 Sampling Time: 00:14:44

Run:

Mode: Trigger Recalibrations: 0 Stop Reason: User Terminated Fluid Volume Imaged: 1.9103 ml Particle Count: 9255

Total: 2583 Used: 1482 Percentage Used: 57.38% Particles Per Used Image: 6.24 Frame Rate: 2.92 fps Intensity Mean: 154.86 Intensity Min: 153.08 Intensity Max: 155.78

Video of Calibration Images Field Endurance Test (Jan – Mar 2012)

Features to look for:

- Flow cell edge movement
- Bubbles around Day 3
- Small colonies being washed away on Days 14 & 22
- "Cleaning event" on **Day 23**
- Changes in lens/lighting imperfections

Conclusions Field Endurance Test (Jan – Mar 2012)

Controlled biofouling in flow cell for 50 days

- Maintained image quality through end of test
- Maintained flow for 45 days
- Corrosion protection adequate

Biofouling control Inlet and Outlet Filters

- Observed loss of flow starting around Day 45
- Inspection and post-mortum points to corrosion on outlet filter as the likely cause
- Next steps: Refurbish unit and address outlet screen corrosion
