## Outline

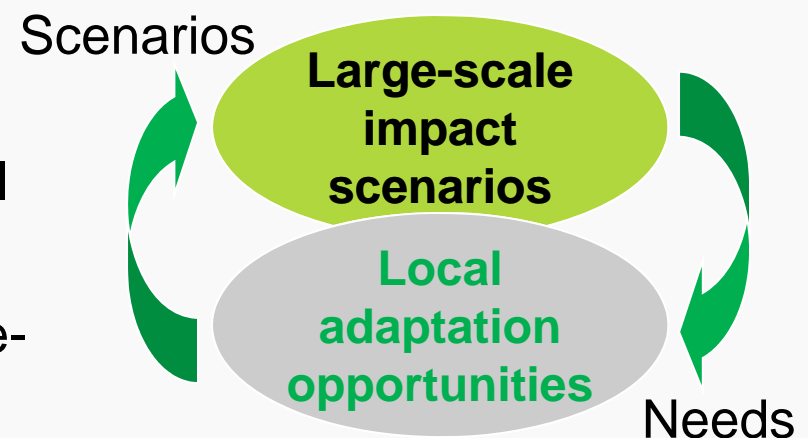

- Introduction to land use scenarios: ICLUS
- Use of scenarios in water quality modeling
- Use of scenarios in vulnerability assessment of Northeastern streams for monitoring

# ICLUS: Integrated Climate and Land Use Scenarios

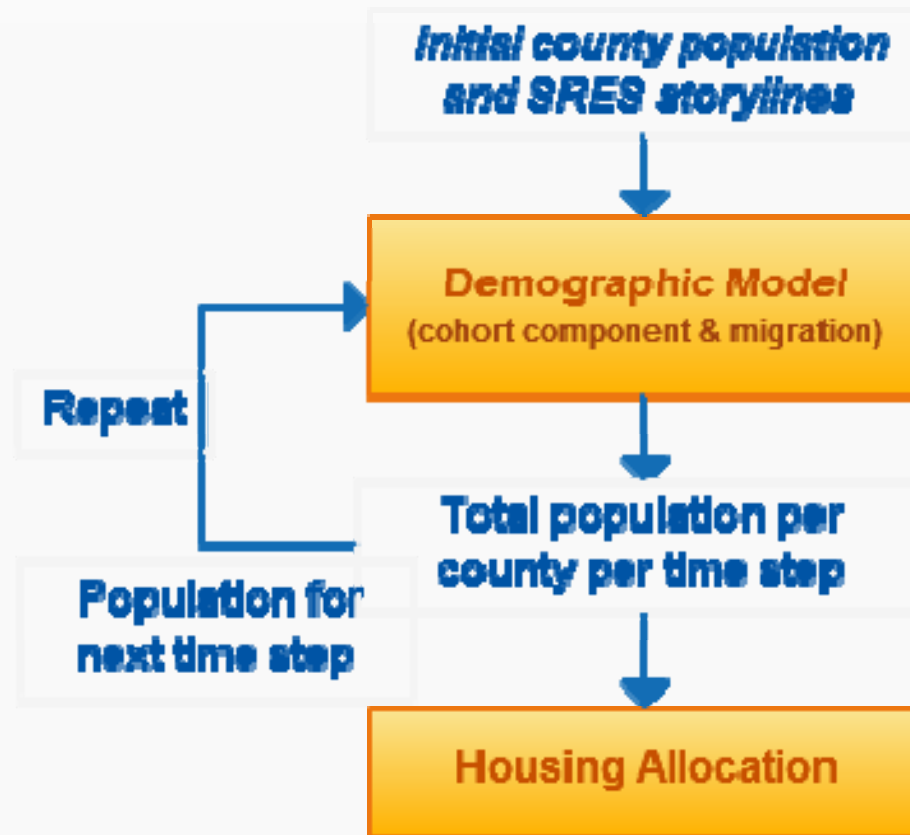

## Goals:

- Create seamless land use scenarios for the conterminous United States consistent with IPCC emissions storylines (SRES)
- Provide consistent benchmarks for local and regional land use studies
- Identify geographic areas where climate-land use interactions may exacerbate impacts or create adaptation opportunities

# ICLUS Conceptual Diagram

**Model and information flow within the ICLUS project**

# Interpretation of SRES for US

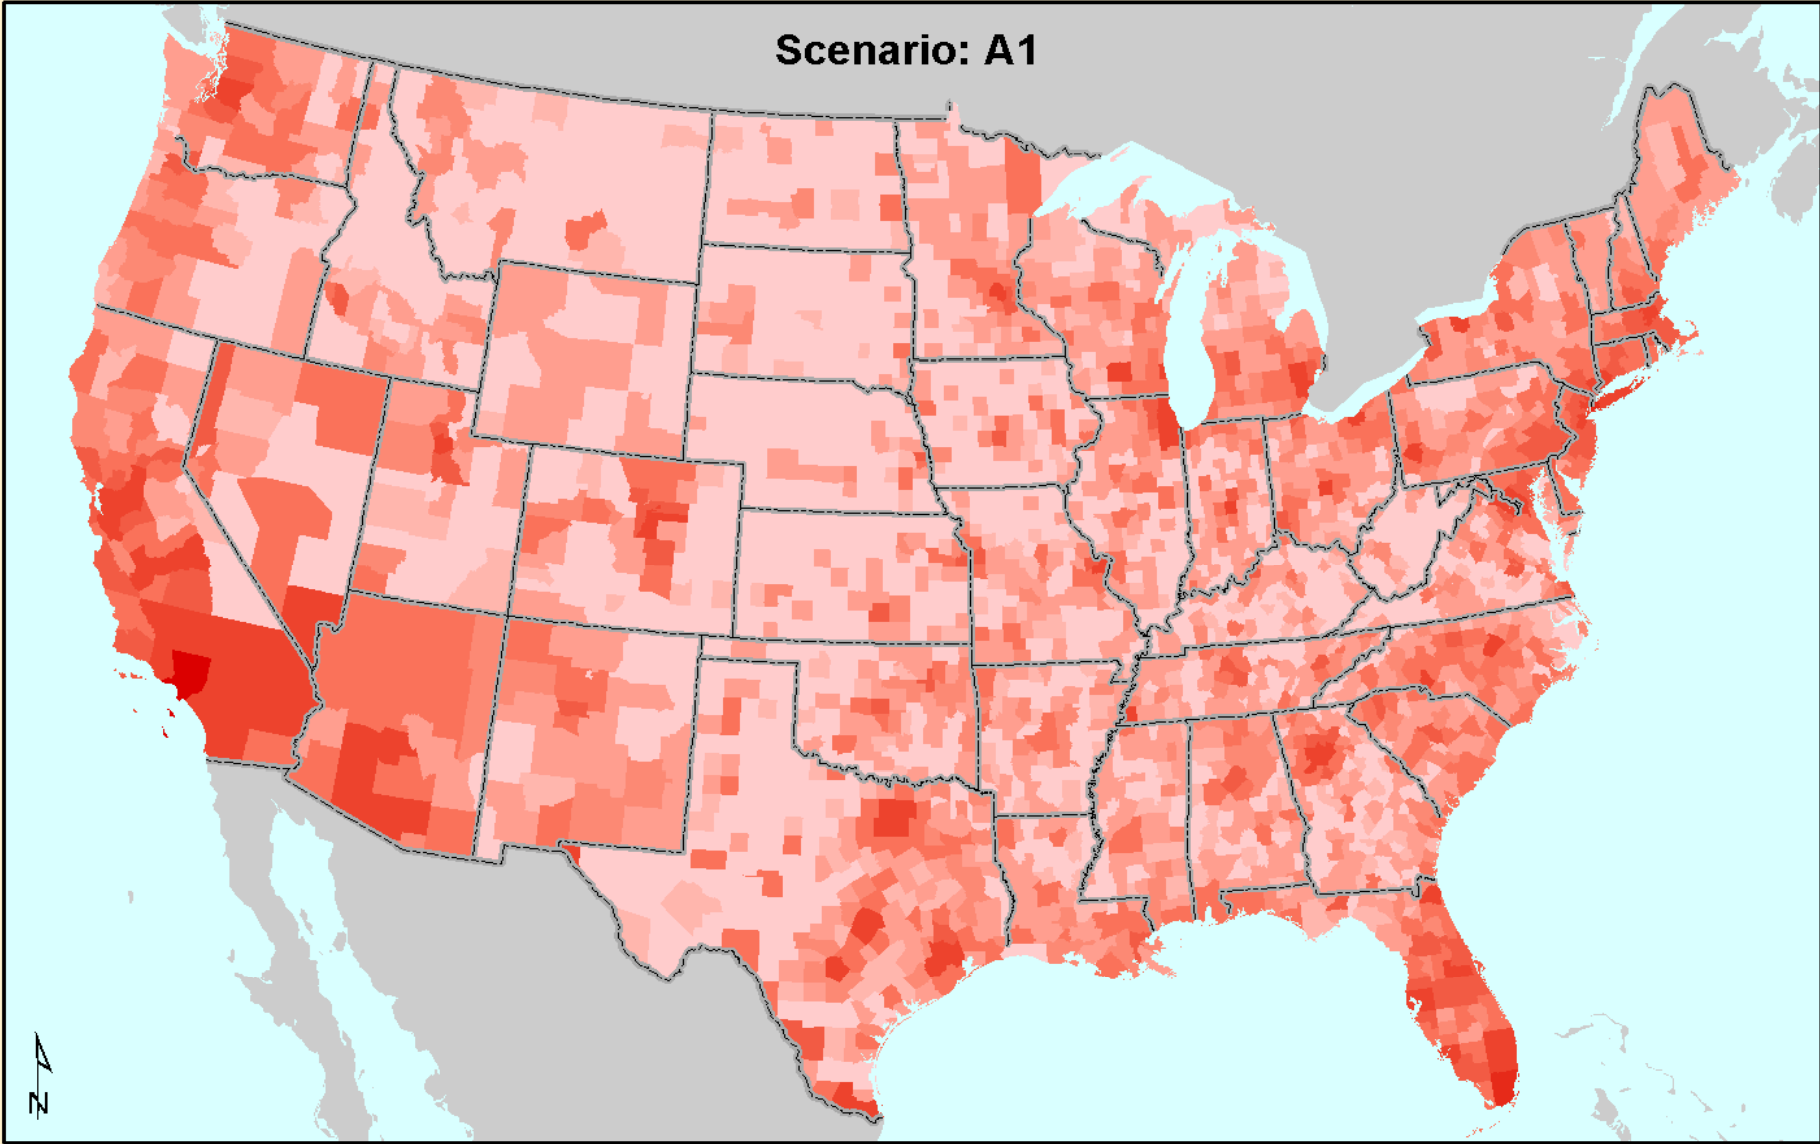

Global Scenario	Demographic Model			Spatial Allocation Model	
	<i>Fertility</i>	<i>Domestic migration</i>	<i>Net int'l migration</i>	<i>Household size</i>	<i>Urban Form</i>
A1: fast econ. dev.; med. pop growth; high global integration	Low	High	High	Smaller (-15%)	No change
B1: med. pop growth; high global integration; rapid social dev.	Low	Low	High	Smaller (-15%)	Slight compact
A2: regional focus, slower econ. growth; low/med int'l migr.; high pop growth	High	High	Low	Larger (+15%)	BAU
B2: moderate econ. dev.; med. pop growth; med int'l migration	Medium	Low	Low	No change	Slight compact
Baseline: US Census medium scenarios	Medium	Medium	Medium	No change	No change

# National Population Projections

Scenario: A1

Thousands of People Per County

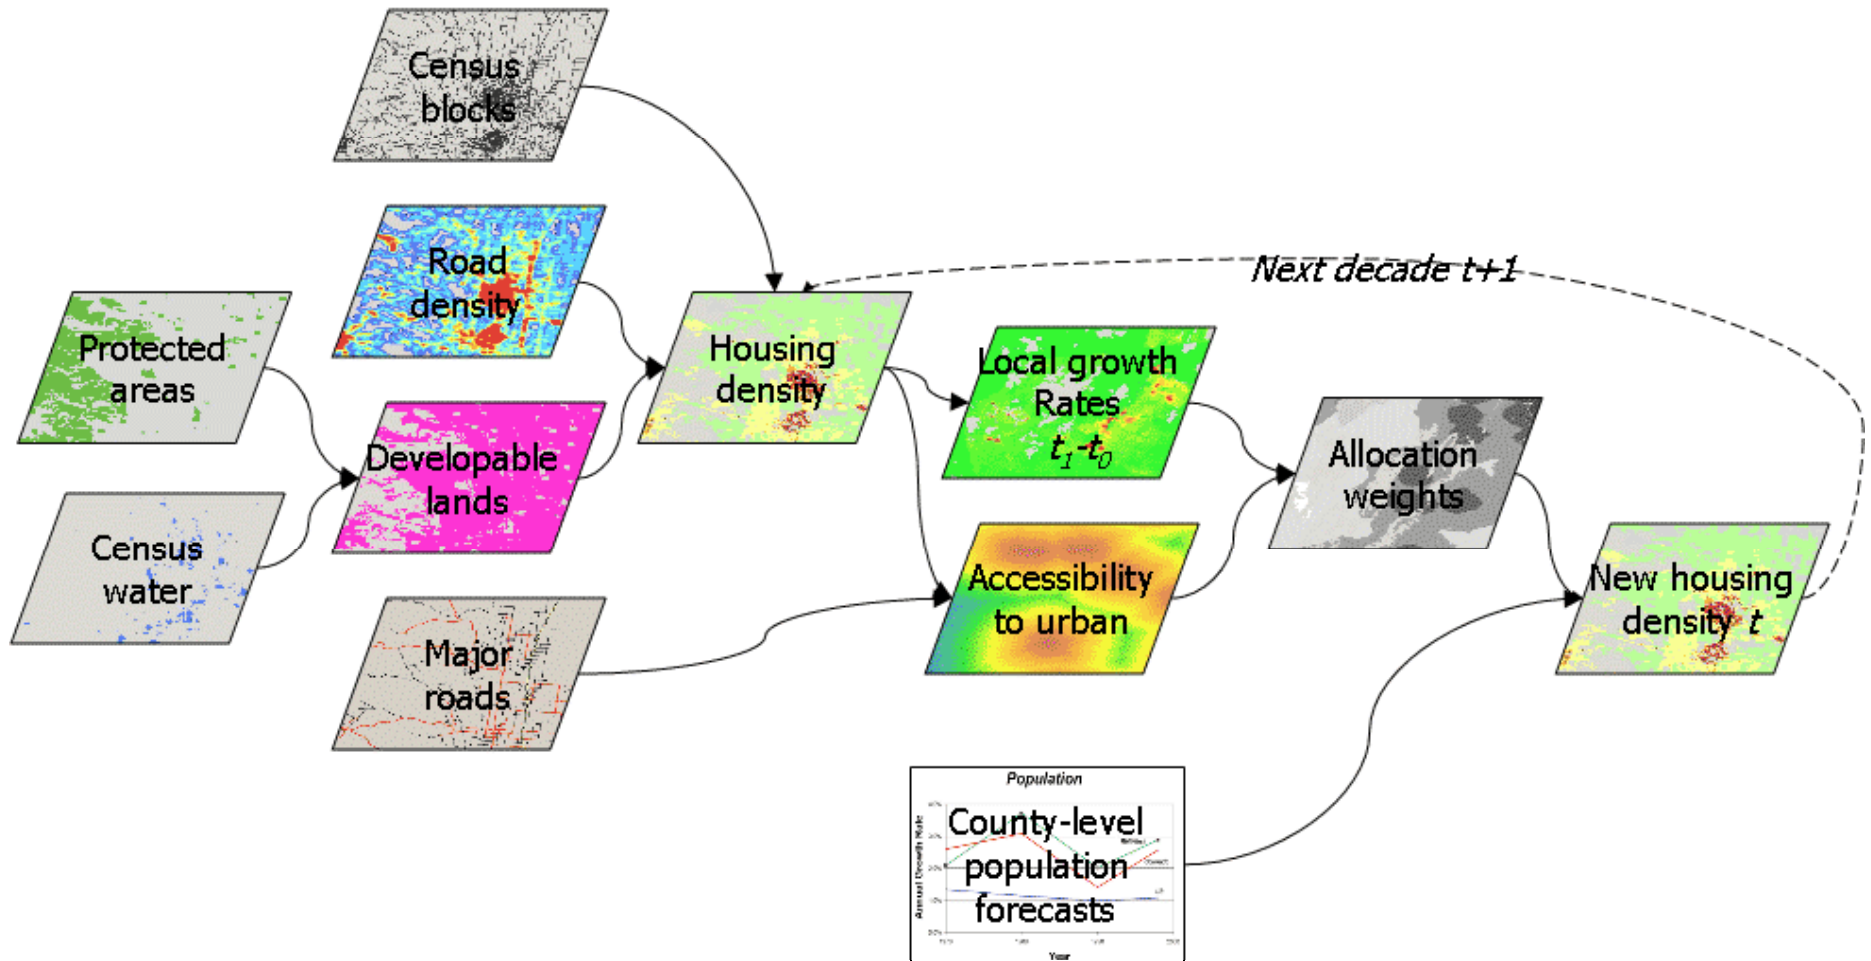

≤ 5	500 - 1,000
5 - 10	1,000 - 5,000
10 - 50	5,000 - 10,000
50 - 100	> 10,000
100 - 500	

**Integrated Climate and Land-Use Scenarios (ICLUS)  
Population Projections for 2050**

**Albers Projection**  
Central Meridian: -96  
1st Std Parallel: 20  
2nd Std Parallel: 60  
Latitude of Origin: 40

# SERGoM v3

## Review: Data to Distribute

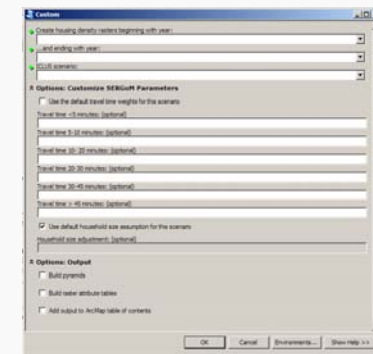

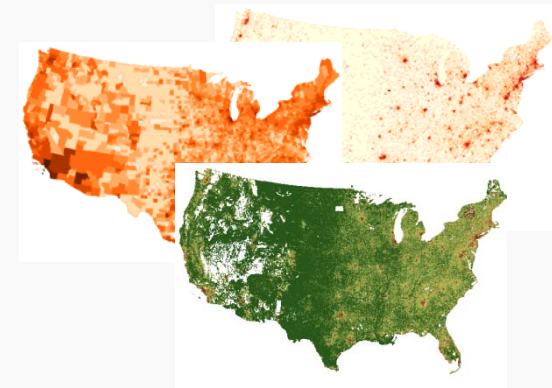

- County population by decade for each scenario (shapefile)
- Classified housing density (raster)
- Impervious surface cover (raster)

# ICLUS Toolbox for ArcGIS

- **Re-create maps**
  - county population
  - housing density (1 ha)
  - impervious surface cover (1 km<sup>2</sup>)
- **Customize SERGoM parameters**
  - more/less compact development pattern
  - household size

Looking ahead...

ICLUS v2.0

## Improvements in ICLUS v2.0

- Really incorporate climate change

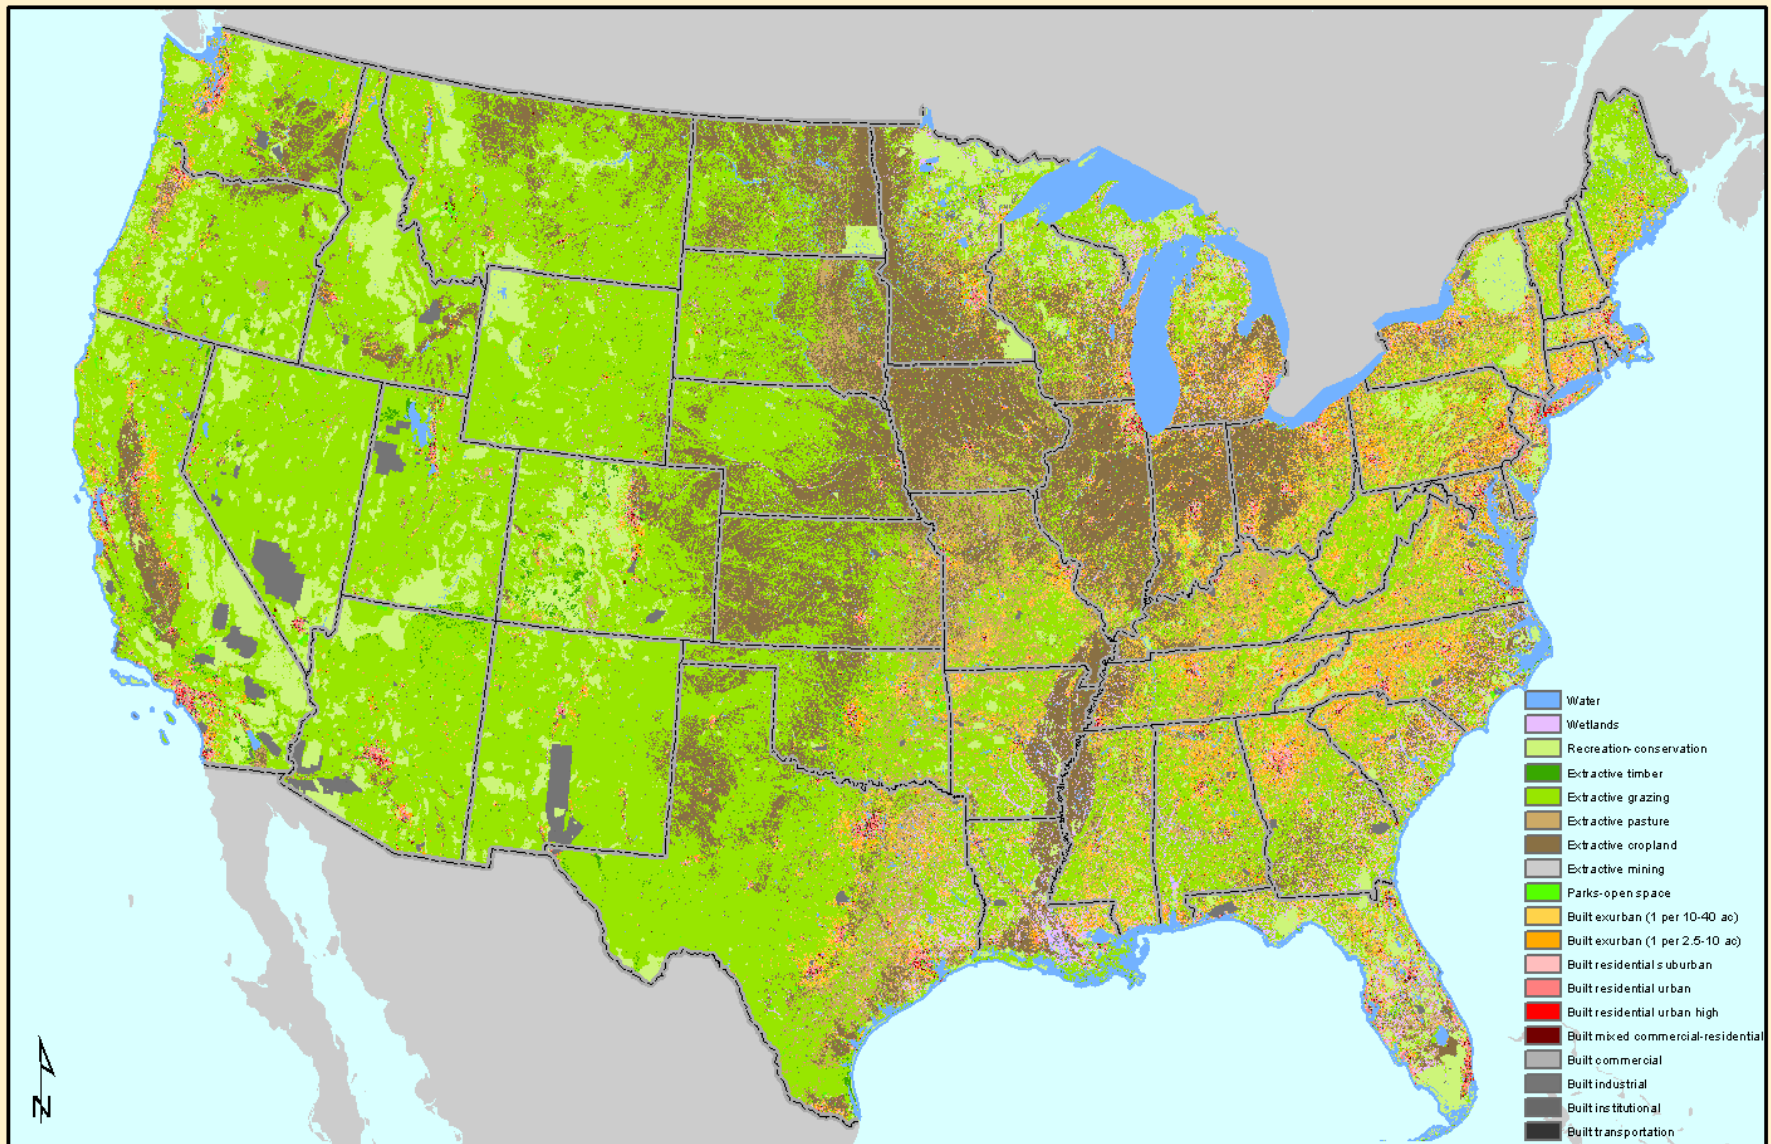

# Climate change information in ICLUS v2.0

- Bias-Correction Spatial Disaggregation-Coupled Model Intercomparison Project phase 3 (BCSD-CMIP3)
  - Three SRES emissions scenarios
  - 16 climate models
- Explore many more possible futures
- Crucial for impacts assessments
  - National migration patterns
  - Regional demographic profiles

## Improvements in ICLUS v2.0

- *Really* incorporate climate change
- Use revised land use categories

# National Land Use Database

Dave Theobald, Colo. State Univ.

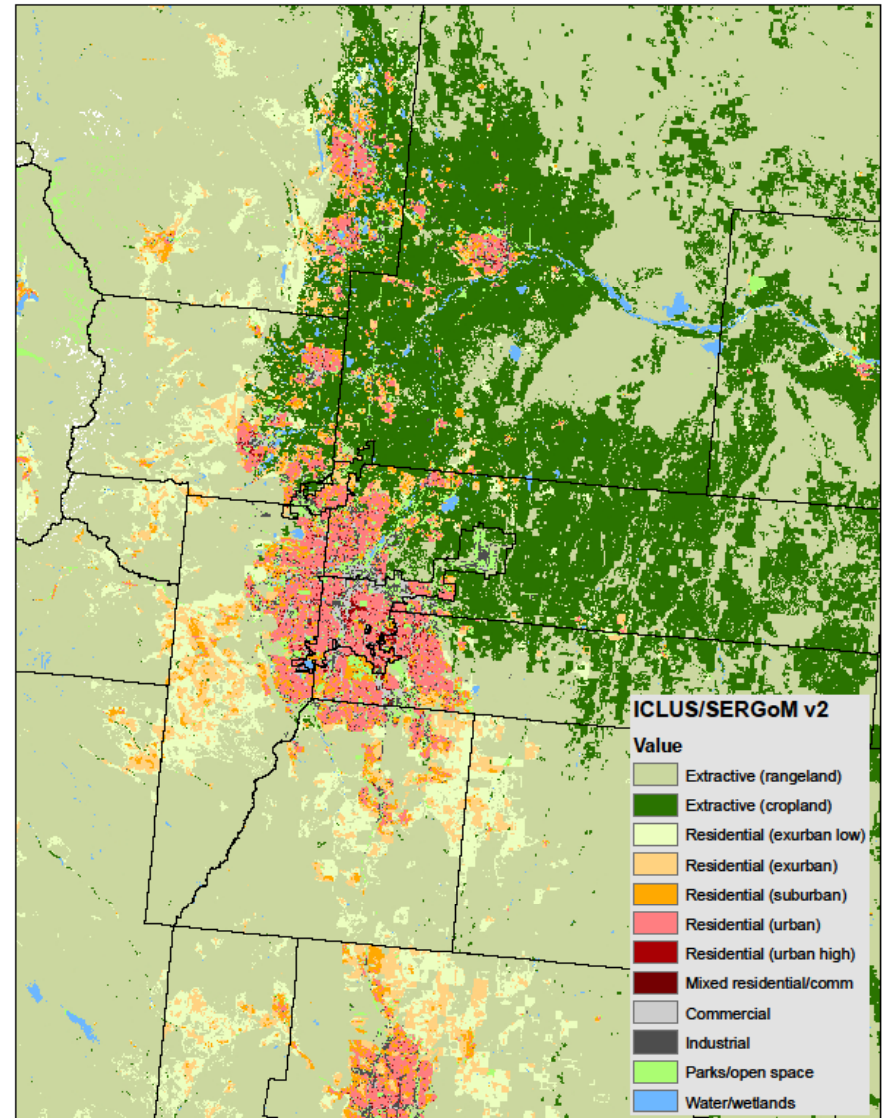

Albers Projection

Central Meridian: -96  
 1st Std Parallel: 20  
 2nd Std Parallel: 60  
 Latitude of Origin: 40

300 Miles

- Public datasets synthesized to ~17 land uses
  - NLCD 2006
  - PAD-US
  - Many others...
- Transition probabilities
  - Dynamic land use, including commercial and industrial!
- Still driven by human development
  - Not a fully dynamic LULC model
- Introduce patterns of development
  - Smart Growth
  - Conservation Clusters
  - Centralized Infilling
- Introduce “effective” percent impervious

## Improvements in ICLUS v2.0

- *Really* incorporate climate change
- Move toward meaningful land use categories
- Regionalize everything

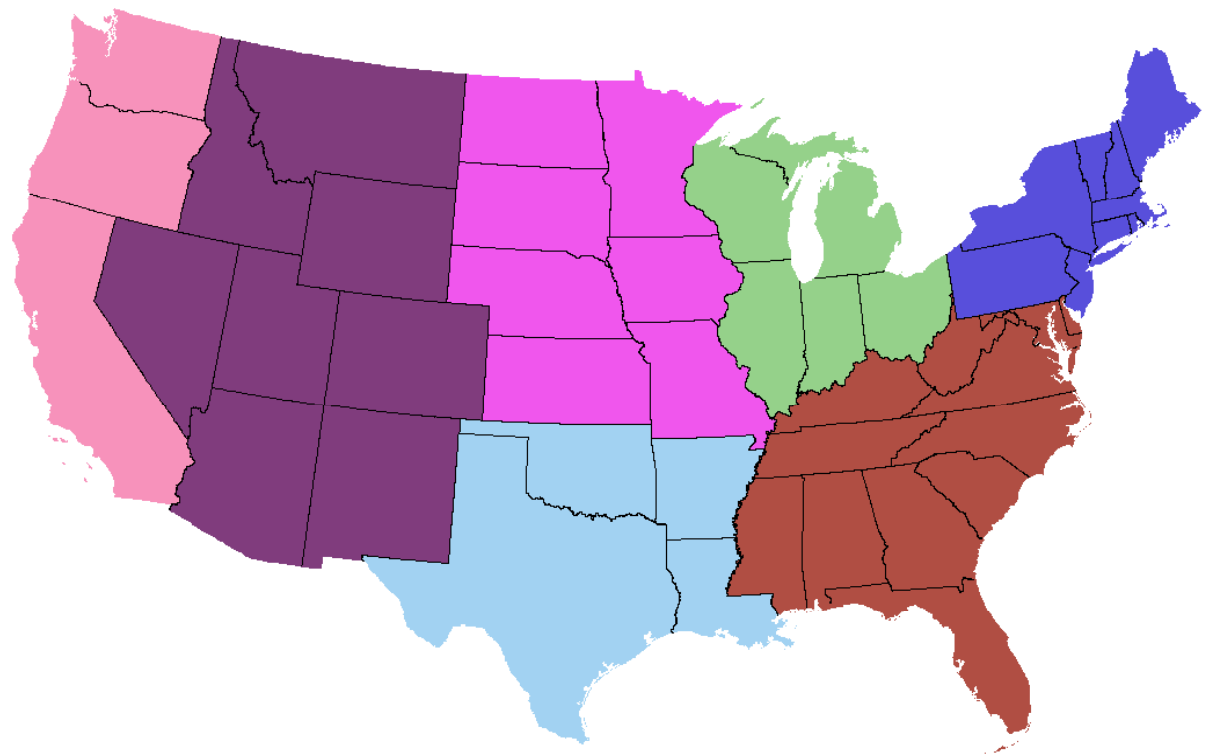

Extract regional  
transition probabilities

Regionalize future  
development patterns

Smart Growth

Conservation Clusters

Centralized Infilling

## Improvements in ICLUS v2.0

- *Really* incorporate climate change
- Move toward meaningful land use categories
- Regionalize development patterns
- **Improve impervious estimates**

## Improvements in ICLUS v2.0

- *Really* incorporate climate change
- Move toward meaningful land use categories
- Regionalize development patterns
- Improve impervious estimates
- Other stuff...
  - Update transportation network – mass transit
  - Better migration data (IRS)

# Modeling water quality in 20 watersheds using variety of climate change and land use scenarios

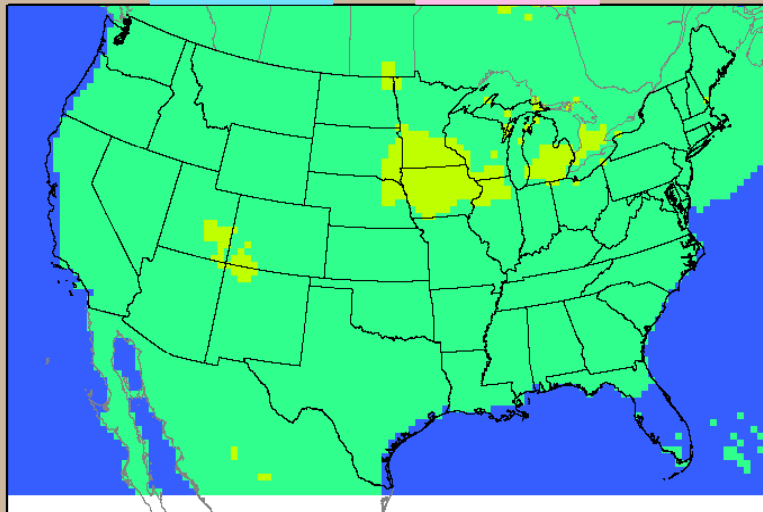

WRFG + CCSM

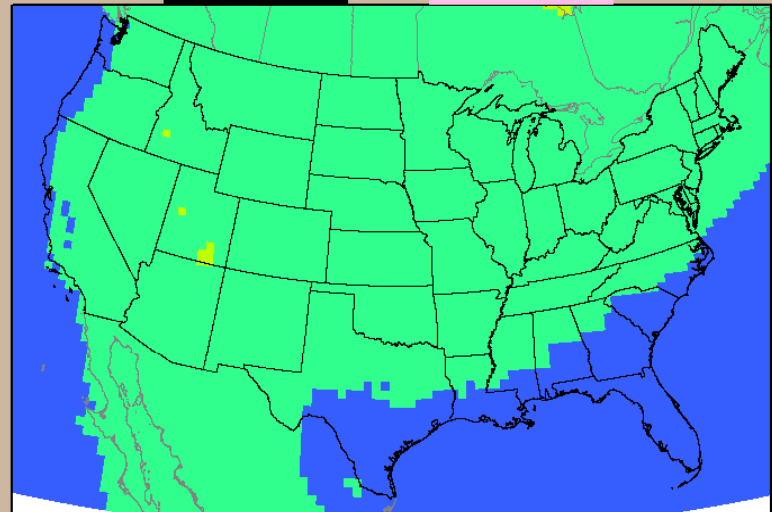

RCM3 + GFDL

CRCM + CGCM3

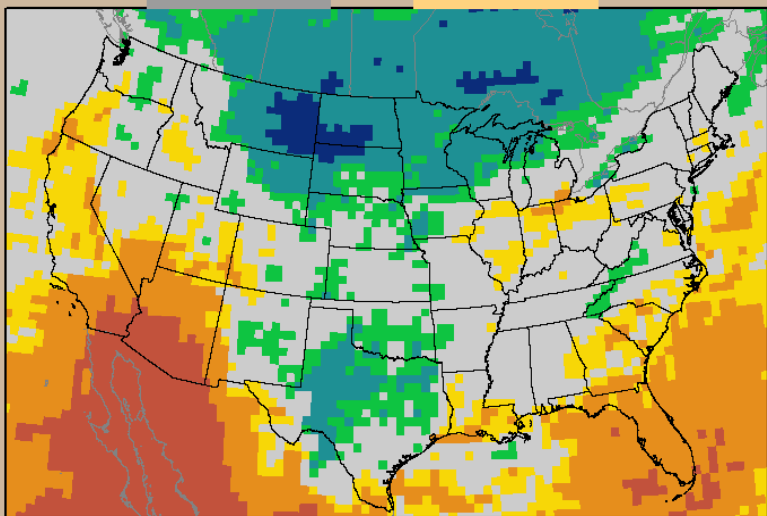

RCM3 + CGCM3

Temperature (°C): Future (2041-2070) minus Historic (1971-2000)

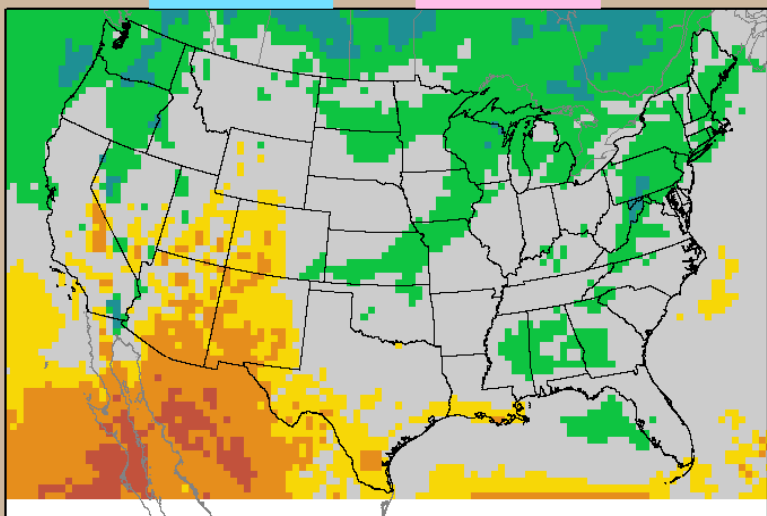

WRFG + CCSM

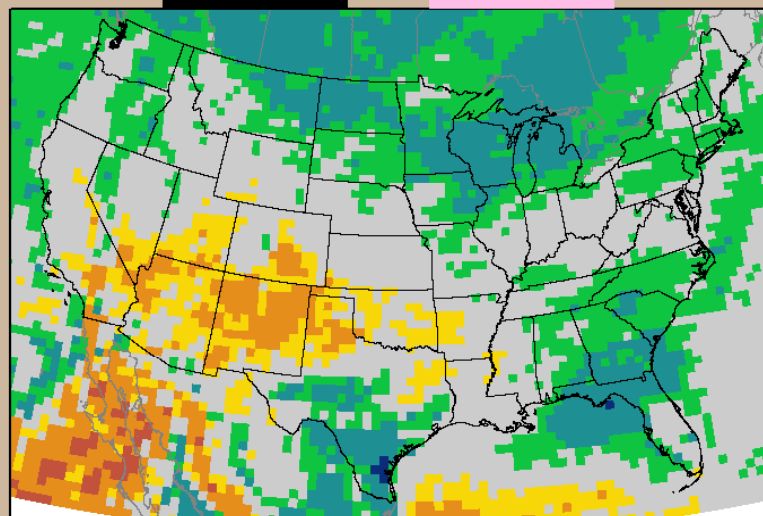

RCM3 + GFDL

CRCM + CGCM3

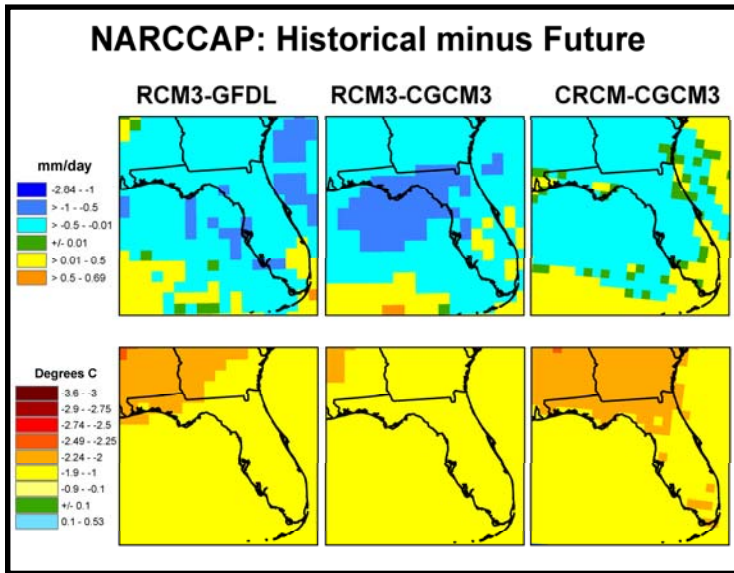

RCM3 + CGCM3

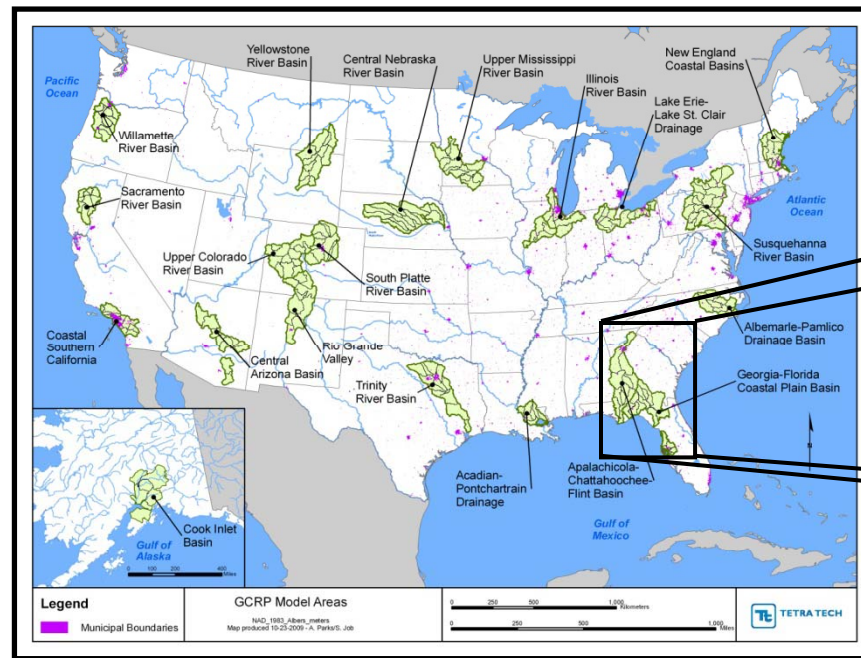

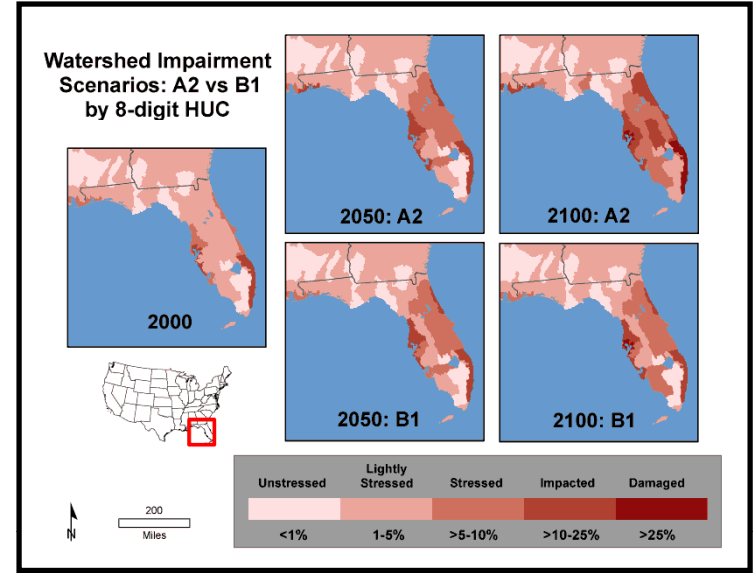

Average Annual Precipitation: % change from 1971-2000 average

# CLIMATE

# LAND USE

# STREAMFLOW, NUTRIENTS, SEDIMENT

# Overview of Watershed Modeling

- Watershed modeling in 20 U.S. watershed regions (~ 10 HUC8 each)
- Focus on streamflow, N, P, sediments
- Daily simulations for 30-year historical and 30-year future periods

## **In 5 pilot watersheds:**

- Use 2 watershed models, HSPF and SWAT
  - 14 climate change scenarios (NARCCAP, raw GCM, BCSD)
  - 2 land-use scenarios, current and future (EPA ICLUS)
- Effects of climate change, land-use change, coupled C-L change
- Sensitivity studies to assess influence of different methods of downscaling

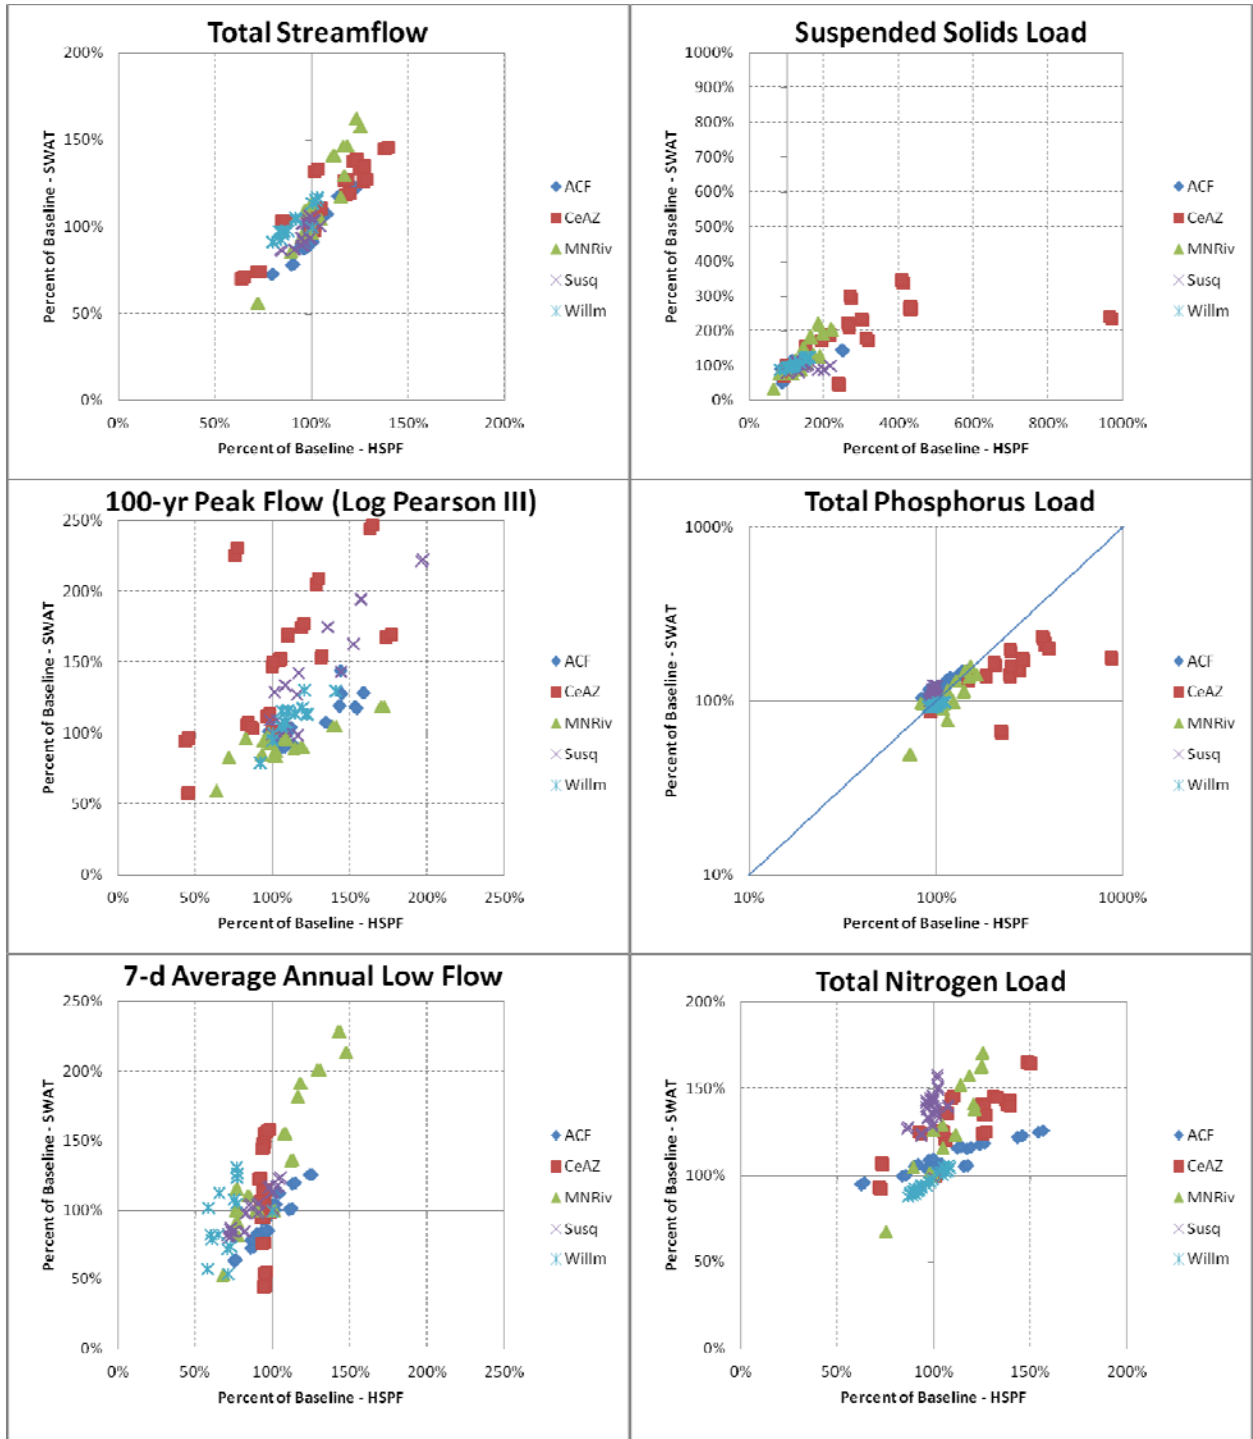

## **In 15 non-pilot watersheds:**

- Use 1 watershed model, SWAT
  - 6 climate change scenarios (NARCCAP)
  - 2 land-use scenarios, current and future (EPA ICLUS)
- Effects of climate change, land-use change, coupled C-L change

# All 5 Pilot Sites

SWAT

HSPF

# 20 Watersheds Project – Key Insights

Sensitivity to climate change different for low flows, high flows, and sediment/nutrient loading – some scenarios result in both lower low flows and increased loading

Strong sensitivity of the modeled flow and water quality endpoints to the climate model and downscaling approach applied

Sensitivity to climate change dominates over sensitivity to land-use change at the scale of an entire watershed – not necessarily true as scale decreases

Climate change, urbanization, and atmospheric CO<sub>2</sub> increase can have synergistic effects on flow and loading

# Use of ICLUS in vulnerability assessment of Northeastern streams for monitoring

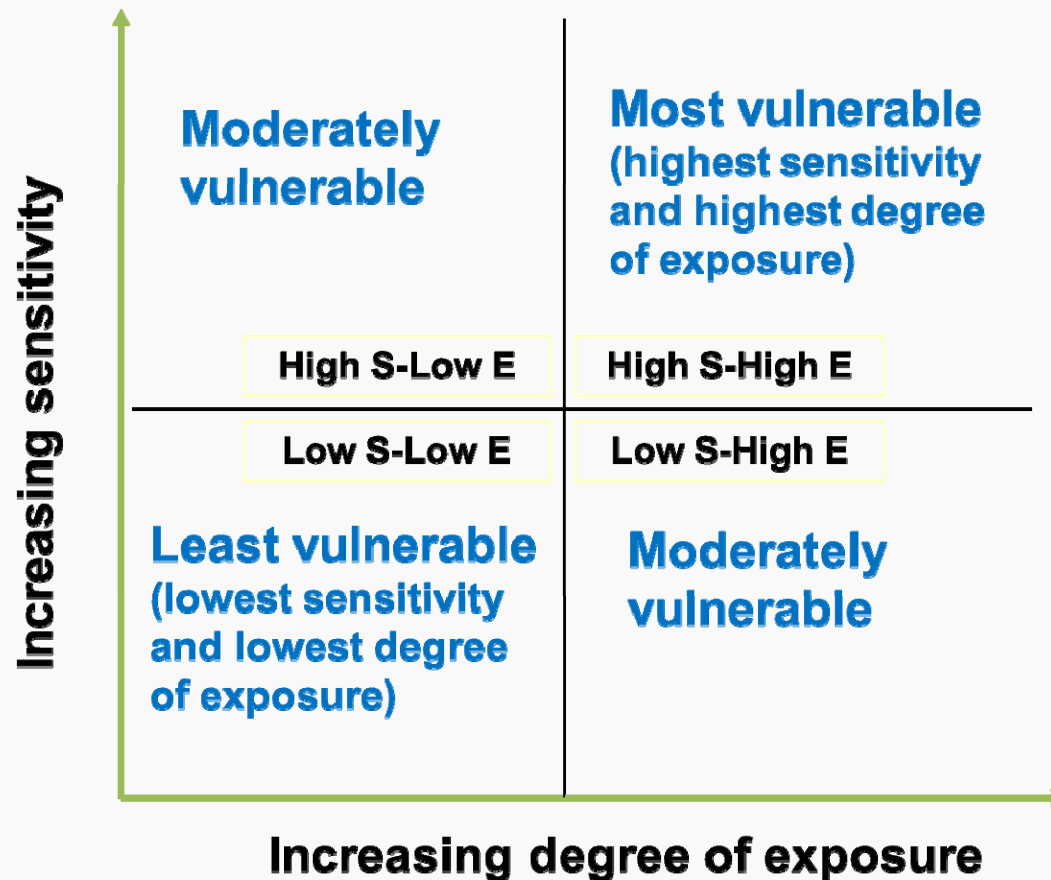

## Monitoring Objectives for Northeastern Streams

- Detect climate-related changes early and inform management (e.g., restoration, adaptation) strategies
- Distinguish climate change effects from other sources of environmental variation and stressors

# Climate Change Vulnerability Assessment

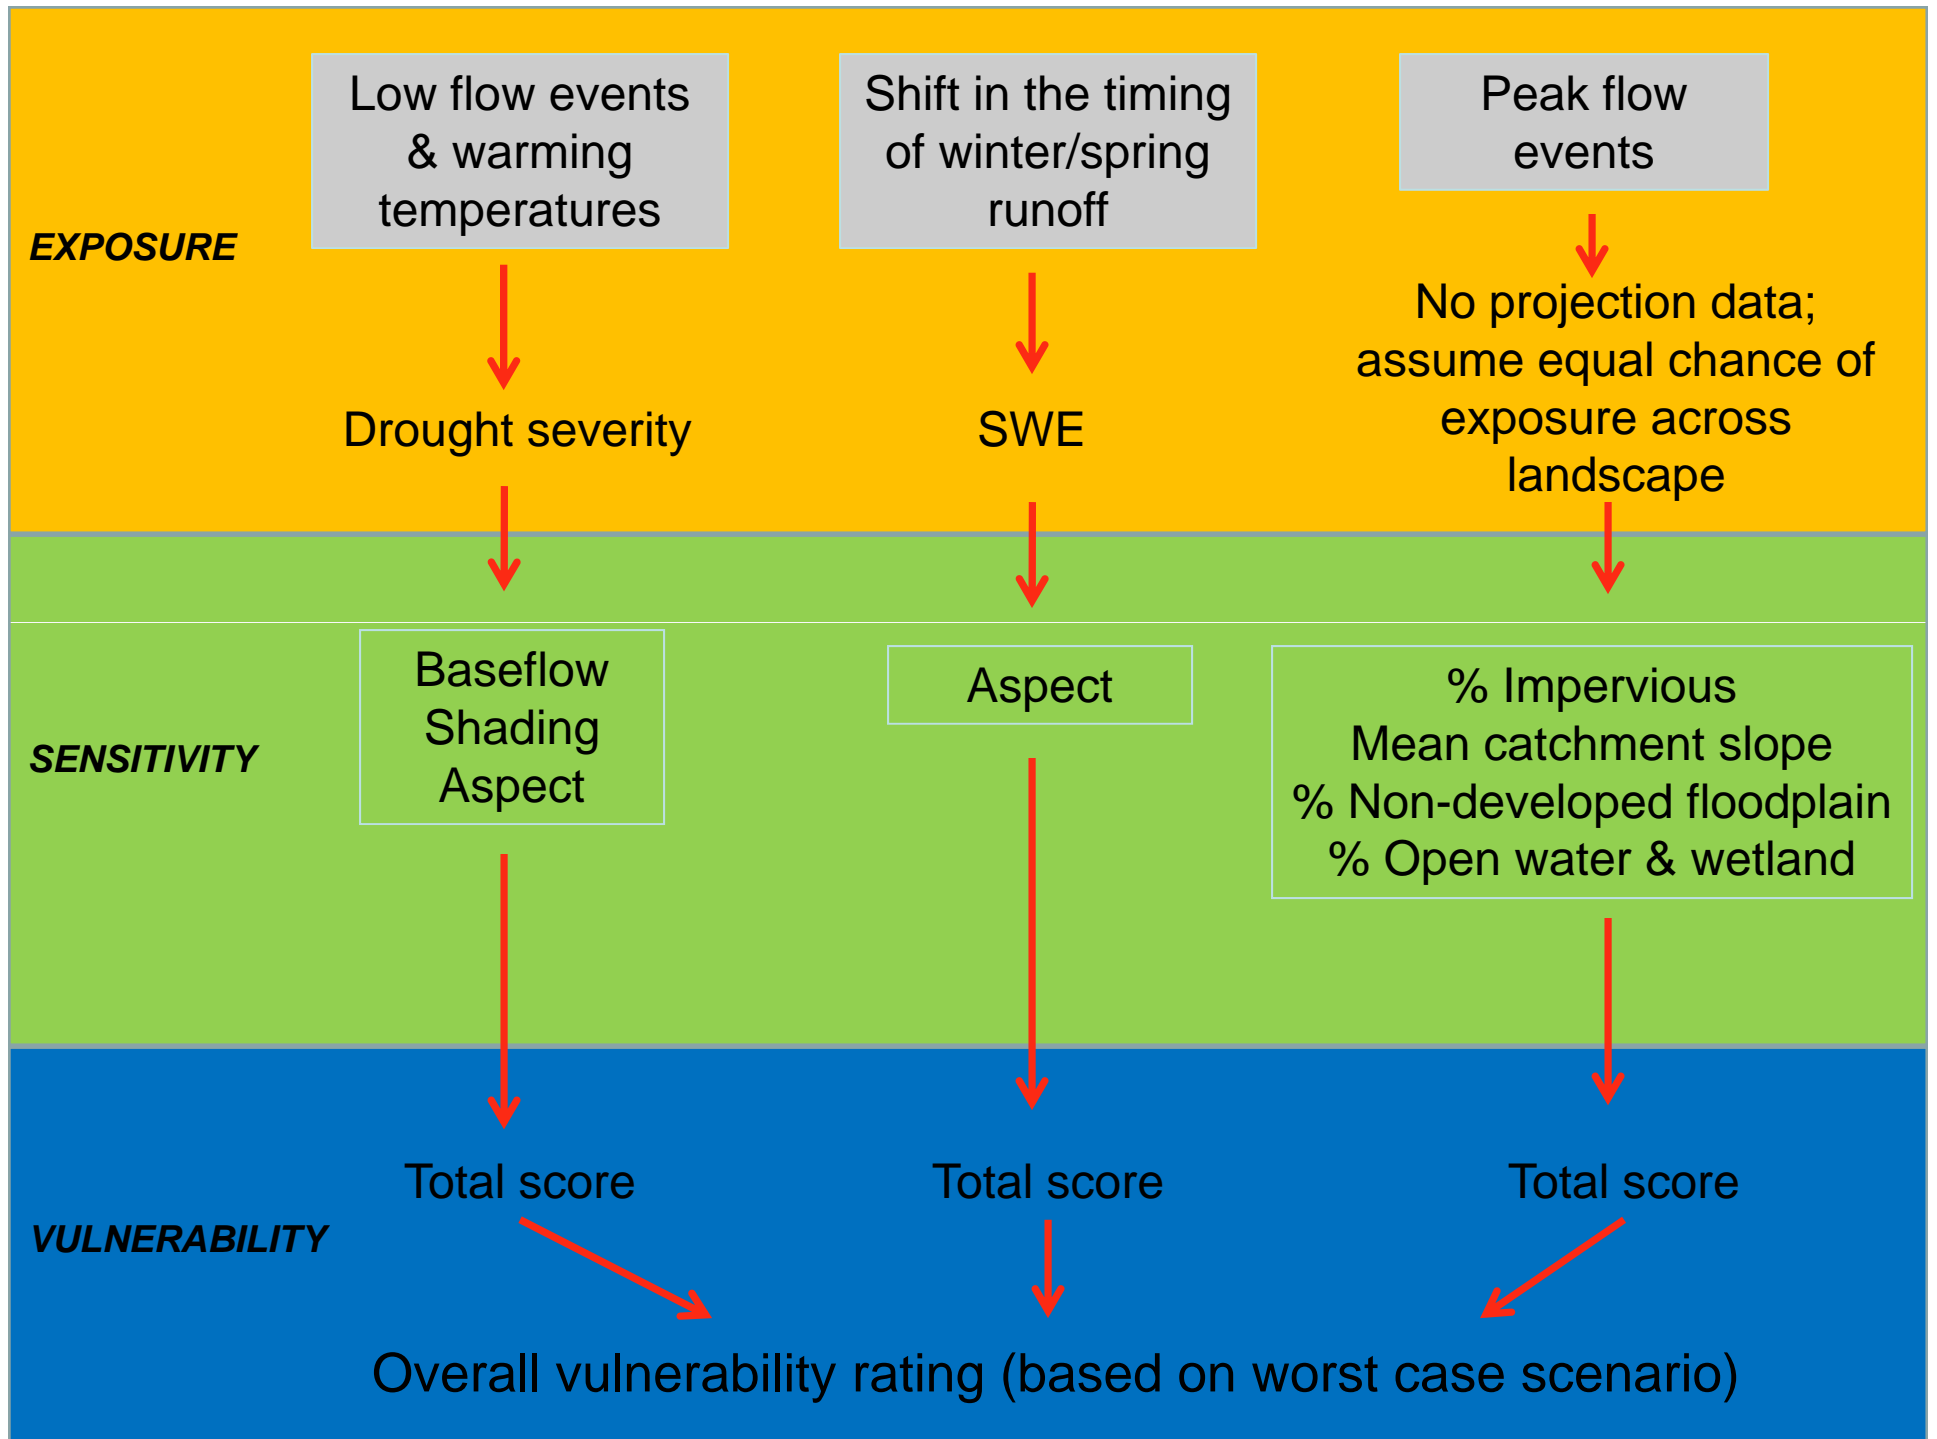

Local catchments sorted by degree of exposure to climatic change (E) X sensitivity (S)

A. Local Catchments for Reaches 20, 21, and 22

NHD-plus local catchments

# EXPOSURE 3: peak flow events

## Reference catchments

### Vulnerability to peak flow events

 Least

 Moderate

 Most

 Non-reference catchments

# Overall vulnerability rating

If we assign an overall vulnerability category based on the 'worst case' rating, most catchments fall in 'most' and 'moderate' vulnerability categories.

Some catchments are most vulnerable to only one exposure type; others to > 1 exposure types.
